What is it ?

- Tree level traverse
- Use queue data structure (for the FIFO)

Run time ?

- The runtime is $O(n)$, but when using a JavaScript array as a queue, it can become $O(n^2)$ due to the shifting operation
→ Use the right data structure

How to do it ?

- push the root
- get the item, do the operation
- push its childrens
- repeat until queue length > 0 (not empty)
