

Queue Data Structures

What is Queue ?

- Singly [Linked list](#) with head and tail
- FIFO (First in First out) - element insert at the tail, remove from the head
- Just kinda like a waiting line in realife for ordering food (。●_●。)

Common operation and How to do it ?

- enqueue (insert at the tail):
 - make current tail next point to new node
 - make new node become tail
- dequeue (remove from the head):
 - store current head (h = this.head)
 - move head forward (this.head = this.head.next)
 - point removed element to null (h.next = null)
 - return the value (h.value)
- peak (view the first element without removing it)
 - just access head.value (^^)/
